

Line filter valve Codeiron®

The line filter valve for the NGV dispenser is a solid particles filter that retains particles greater than 50 microns.

This filter prevents the obstruction of the ducts and pipes of the dispenser, avoiding the damage of the internal parts of the valves, especially the three-way loading valve and the mass meters.

One filter is generally used by dispenser, however up to two can be used.

One of the advantages of this filter is that, unlike many others in the market, it has a design that produces an effective operation with high cleaning performance, due to its greater surface of filtration.

It is completely made of stainless steel, which means a longer life compared to other brands in the market that are brass valves. These filters have a problem because they frequently become clogged and the technical staff decides to remove the filters, therefore the dispenser is unprotected.

We manufacture a maintenance kit for the filter valve, so that its lifetime is very long.

It is available in every flow measure required, 1/4 NPT, 3/8 NPT, and 1/2 NPT female connection. (Please see the attached technical features).
